

## Electromagnetic Multi-Disc Clutch

Clutch with outer driver for torque transmission between shaft and free wheeling gear part.

For oil and dry operation, coil voltage 24 V DC

- ◆ Clutch with adjustable gap.
- ◆ Suited for speed and feed engagements.
- ◆ High energy absorption by wear resistant steel- / sinter discs.
- ◆ Effective heat dissipation by peripheral friction faces.
- ◆ For horizontal mounting.

The clutch is suited for external gear application, but also used, with oil lubrication, in gears.

The magnetic flux does not circulate through the disc stack, this makes it possible to use non magnetic friction material for high power and torque load at the lowest wear rate.

Current intake through slip ring and return through earth connection (-). Available in special design suitable for combustion-engine applications.
